Cl	100.00 out of 100.00
Marks	5.00/5.00
Time taken	3 days 16 hours
Completed on	Wednesday, 19 June 2024, 11:36 AM
State	Finished
Started on	Saturday, 15 June 2024, 7:25 PM

Question **1**Correct

Mark 1.00 out of 1.00

Write a Python program to sort a <u>list</u> of elements using the merge sort algorithm.

For example:

Input	Result		
5	3 4 5 6 8		
6 5 4 3 8			

Answer: (penalty regime: 0 %)

	Input	Expected	Got	
~	5 6 5 4 3 8	3 4 5 6 8	3 4 5 6 8	~
~	9 14 46 43 27 57 41 45 21 70	14 21 27 41 43 45 46 57 70	14 21 27 41 43 45 46 57 70	~
~	4 86 43 23 49	23 43 49 86	23 43 49 86	~

Passed all tests! 🗸

Correct

Marks for this submission: 1.00/1.00.

```
Question 2
Correct
Mark 1.00 out of 1.00
```

An <u>list</u> contains N numbers and you want to determine whether two of the numbers sum to a given number K. For example, if the input is 8, 4, 1, 6 and K is 10, the answer is yes (4 and 6). A number may be used twice.

Input Format

The first line contains a single integer n , the length of $\underline{\text{list}}$

The second line contains n space-separated integers, <u>list[i]</u>.

The third line contains integer k.

Output Format

Print Yes or No.

Sample Input

7 0 1 2 4 6 5 3

Sample Output

Yes

For example:

Input	Result
5 8 9 12 15 3 11	Yes
6 2 9 21 32 43 43 1 4	No

Answer: (penalty regime: 0 %)

```
# Read input from user
   n=int(input())
3
   numbers=list(map(int,input().split()))
4
    k = int(input())
   # Iterate through then list of numbers
7 ▼ for i in range(n):
8 •
        for j in range(i + 1, n):
            # check if the sum of current pair equals K
9
10 •
            if numbers[i] + numbers[j] == k:
                print("Yes")
11
                exit() # Exit the program after printing "Yes"
12
13
   # If no such pair is found, print "No"
14
   print("No")
```

	Input	Expected	Got	
~	5 8 9 12 15 3 11	Yes	Yes	~
~	6 2 9 21 32 43 43 1 4	No	No	~
~	6 13 42 31 4 8 9 17	Yes	Yes	~

Passed all tests! 🗸

Correct

Marks for this submission: 1.00/1.00.

```
Question 3
Correct
Mark 1.00 out of 1.00
```

Given an listof integers, sort the array in ascending order using the Bubble Sort algorithm above. Once sorted, print the following three lines:

- 1. <u>List</u> is sorted in numSwaps swaps., where numSwaps is the number of swaps that took place.
- 2. First Element: firstElement, the *first* element in the sorted <u>list</u>.
- 3. Last Element: lastElement, the *last* element in the sorted <u>list</u>.

For example, given a worst-case but small array to sort: a=[6,4,1]. It took 3 swaps to sort the array. Output would be

```
Array is sorted in 3 swaps.

First Element: 1

Last Element: 6
```

Input Format

The first line contains an integer, n , the size of the $\underline{\text{list}}$ a .

The second line contains n, space-separated integers a[i].

Constraints

- · 2<=n<=600
- \cdot 1<=a[i]<=2x10⁶.

Output Format

You must print the following three lines of output:

- 1. List is sorted in numSwaps swaps., where numSwaps is the number of swaps that took place.
- 2. First Element: firstElement, the *first* element in the sorted <u>list</u>.
- 3. Last Element: lastElement, the *last* element in the sorted <u>list</u>.

Sample Input 0

3

123

Sample Output 0

List is sorted in 0 swaps.

First Element: 1

Last Element: 3

For example:

Input	Result
3 3 2 1	List is sorted in 3 swaps. First Element: 1 Last Element: 3
5 1 9 2 8 4	List is sorted in 4 swaps. First Element: 1 Last Element: 9

Answer: (penalty regime: 0 %)

```
1 v def bubble_sort(arr):
2
        num_swaps=0
3
        n=len(arr)
4.
        for i in range (n):
5
            swapped= False
            for j in range (0,n-i-1):
6
7
                if arr[j]>arr[j+1]:
8
                     arr[j], arr[j+1]=arr[j+1],arr[j]
9
                     num_swaps +=1
10
                     swapped= True
11 •
            if not swapped:
```

```
preak
return num_swaps
n=int(input())
arr=list(map(int,input().split()))
num_swaps=bubble_sort(arr)
print("List is sorted in", num_swaps,"swaps.")
print("First Element:",arr[0])
print("Last Element:",arr[-1])
```

	Input	Expected	Got	
~	3 3 2 1	List is sorted in 3 swaps. First Element: 1 Last Element: 3	List is sorted in 3 swaps. First Element: 1 Last Element: 3	~
~	5 1 9 2 8 4	List is sorted in 4 swaps. First Element: 1 Last Element: 9	List is sorted in 4 swaps. First Element: 1 Last Element: 9	~

Passed all tests! <

Correct

Marks for this submission: 1.00/1.00.

11

```
Question 4
Correct
Mark 1.00 out of 1.00
```

Write a Python program for binary search.

For example:

Input	Result
1,2,3,5,8	False
3,5,9,45,42 42	True

Answer: (penalty regime: 0 %)

```
2 ▼ def binary_search(arr,x):
        # Ensure the array is sorted
 3
 4
        arr.sort()
 5
 6
        # Initialize left and right pointers
        left,right = 0,len(arr) - 1
 7
 8
        # Binary serach algorithm
9
10
        while left <= right:</pre>
            mid = (left+right) // 2
11
12
            \# Check if x is present at mid
            if arr[mid] == x:
13
14
                return True
            \#If \ x is greater, ignore left half
15
            elif arr[mid] < x:</pre>
16
                left = mid + 1
17
18
            #If x is smaller, ignore right half
19 •
            else:
20
                right=mid - 1
21
        # If we reach here, the element was not present
22
        return False
23
    # Input from user
24
   numbers = list(map(int,input().split(',')))
25
26
    target = int(input())
27
    # perform binary search
28
   result = binary_search(numbers, target)
29
    print(result)
30
31
```

	Input	Expected	Got	
~	1,2,3,5,8	False	False	~
~	3,5,9,45,42 42	True	True	~
~	52,45,89,43,11 11	True	True	~

Passed all tests! <

Correct

Marks for this submission: 1.00/1.00.

```
Question 5
Correct
Mark 1.00 out of 1.00
```

Bubble Sort is the simplest <u>sorting</u> algorithm that works by repeatedly swapping the adjacent elements if they are in wrong order. You read an <u>list</u> of numbers. You need to arrange the elements in ascending order and print the result. The <u>sorting</u> should be done using bubble sort.

Input Format: The first line reads the number of elements in the array. The second line reads the array elements one by one.

Output Format: The output should be a sorted <u>list</u>.

For example:

Input	Result
6 3 4 8 7 1 2	1 2 3 4 7 8
5 4 5 2 3 1	1 2 3 4 5

Answer: (penalty regime: 0 %)

	Input	Expected	Got	
~	6 3 4 8 7 1 2	1 2 3 4 7 8	1 2 3 4 7 8	~
~	6 9 18 1 3 4 6	1 3 4 6 9 18	1 3 4 6 9 18	~
~	5 4 5 2 3 1	1 2 3 4 5	1 2 3 4 5	~

Passed all tests! <

Correct

Marks for this submission: 1.00/1.00.
